

ABSTRACT

The invention relates to a distributor device for unset concrete. The distributor device comprises a delivery conduit that can be connected to the pressure outlet (78) of a concrete pump (72) on the inlet side and is provided with an outlet part (tube pieces 22, 26, 30) that can be moved to a concreting point via a manipulator (hydraulic cylinder 38, 40). According to the invention, the outlet part of the delivery conduit is arranged, with the associated manipulator, on a mobile chassis (44) that is separate from the concrete pump (72), and of which the inlet side can be connected to the pressure outlet (78) of the concrete pump (72) by means of an at least partially moveable connecting conduit (50).
